

PathOS Backend Completion Analysis

1. Current Backend Capability

The backend includes a substantial API surface, USAJOBS adapter integration, SQLite persistence with migrations, a worker loop with scheduler locking, CI enforcement (lint, typecheck, pytest, OpenAPI drift), and 90%+ coverage compliance.

2. Definition of Backend Completion

Beta completion requires both product and operational completeness.

Product: search, saved searches, delta detection, digest generation, export/audit, stable desktop contracts.

Operational: import-safe factory, lifespan-compliant startup, structured logging, runbooks, minimal auth posture.

3. Identified Remaining Gaps

Startup lifecycle modernization; delivery implementation beyond no-op; ingestion ledger formalization; USAJOBS mapper coverage hardening; minimal API security controls; production database transition readiness.

4. Remaining Work Structure

Slice Group A – Import and Lifespan Hardening; Slice Group B – Delivery v1; Slice Group C – Ingestion Ledger; Slice Group D – Mapper Hardening; Slice Group E – Security Controls; Slice Group F – Production Transition.
